

User Requirement/Tasks:

- Select a body part to workout and get randomized exercises to do.
- Compete and challenge friends.
- Count calories taken in and burned.
- Ask questions and give answers/encouragement to people in app community.
- Look back at previous workout history.

To test learnability and see how easy this app is to use, we will instruct our users to perform simple tasks (add in calorie intake for today, post a question, find workout history from March 2019, check whose in 1st place today, find a chest workout to do, etc.) and observe the time it takes them to complete such task and their expressions. We will have questions after to see what they thought of the experience (Was that simple to do? Was any part of the process confusing? Do we need to add/remove anything to simplify the process?).

Being present during these evaluations will help us to determine their initial expression and get raw, truthful opinions about our app.

Our plan to evaluate our app is to sit down with them and see their expressions, and then give them an online survey to ask questions about learnability, usability, initial thoughts, what they liked, what they hated, etc. and make it more anonymous. We think it is best to be there to see the initial reaction and be there to observe the process and steps each person takes to complete the tasks. The benefit of the survey is that they can be truthful without having the fear of possibly being negative since the survey is anonymous.
